Lab 6 · Favorites Roulette

Oct 14, 2026 · @Arman Myrzakanurov

Build a single-screen iOS app that shows a random card from a list of your 10 favorite things.

Task

Choose one category (movies, books, food, games, etc.) and 10 favorites in it. Each tap on the button shows a random favorite as a card: an image, a title and a short description.

Requirements

Project

- iOS App template, Interface: Storyboard, Language: Swift
- Display Name set to the app's name
- Builds and runs on the Simulator without errors or crashes

Data

- One category, exactly 10 favorites
- Each favorite has an image in `Assets.xcassets`, a title and a description
- Favorites are stored as an array of a `struct`

Main screen

- Layout is built in `Main.storyboard`
- Uses at least `UIImageView`, `UILabel` and `UIButton`
- No Auto Layout: no constraints in any storyboard
- On launch, the screen shows an initial state, not empty views
- Images are not stretched; text is not cut off

Behavior

- Tapping the button shows a random favorite; image, title and description update together
- The same favorite must not appear twice in a row
- No force unwraps (`!`), except `@IBOutlet` declarations

Launch screen

- Custom `LaunchScreen.storyboard`, styled to match the app (not the default blank screen)
- No constraints

App icon

- Custom `AppIcon`: 1024 × 1024 PNG, no transparency
- Visible on the Simulator's Home Screen

Submission

- The project pushed to your own Git repository (one repository per student), submitted as a link
- README.md in the repository with three screenshots: launch screen, main screen, Home Screen with the icon
- Deadline: as announced in class
